Math 308 Project

Euclid's Book III
Propositions 20, 21, 22, 27

Rubens Tse
#77921997

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

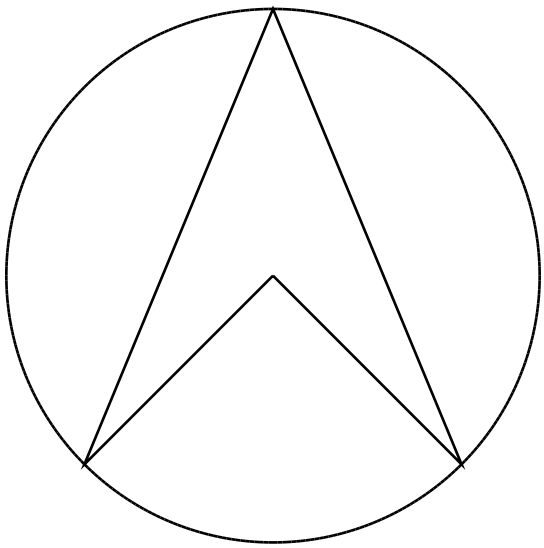
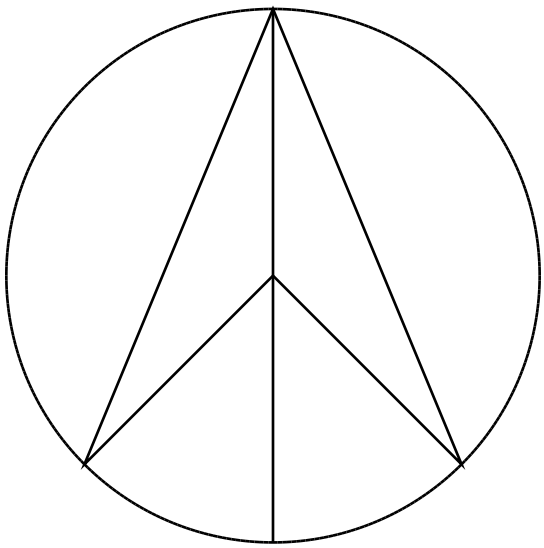
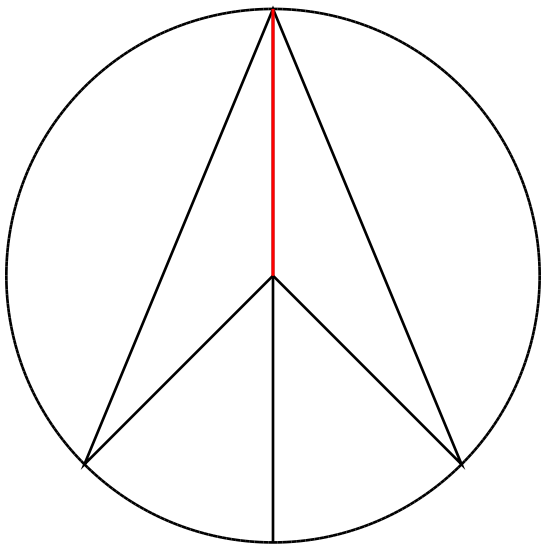
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



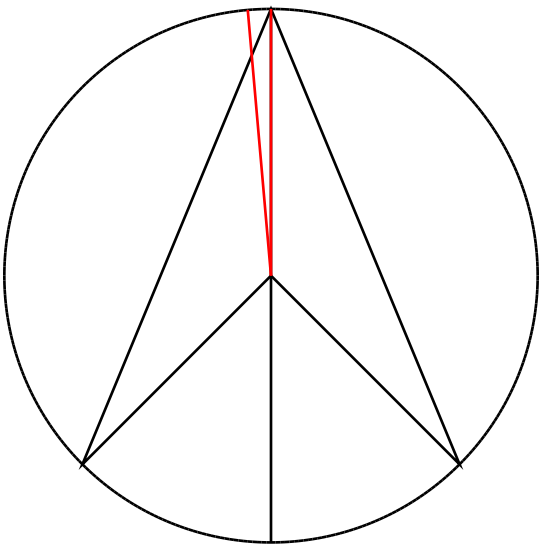
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



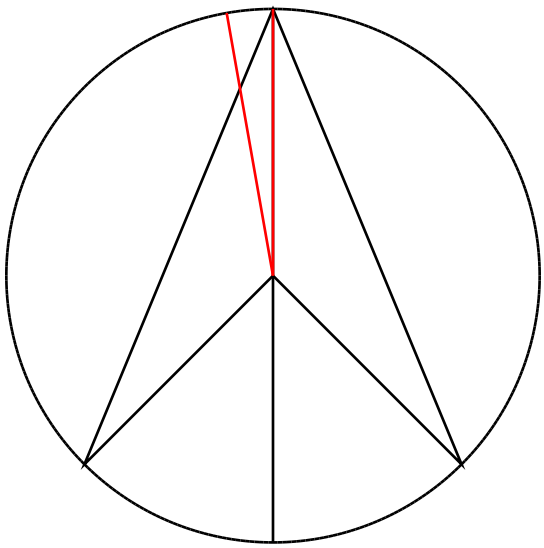
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



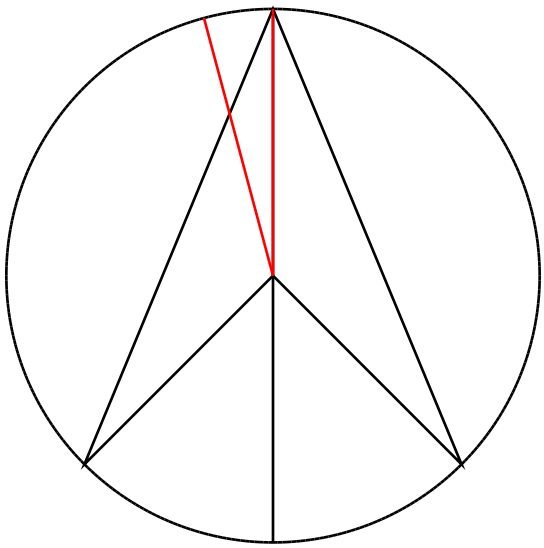
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



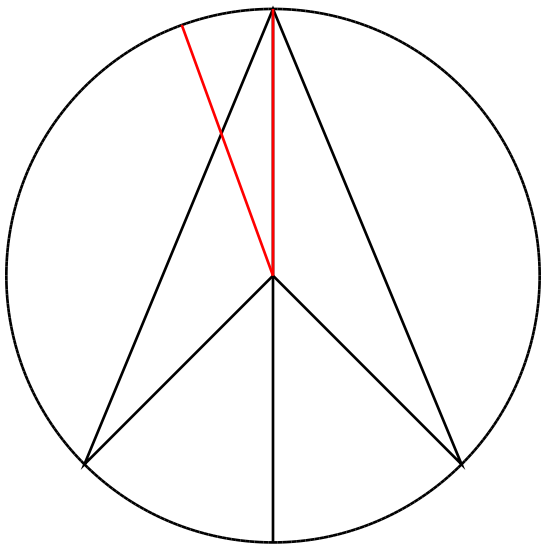
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



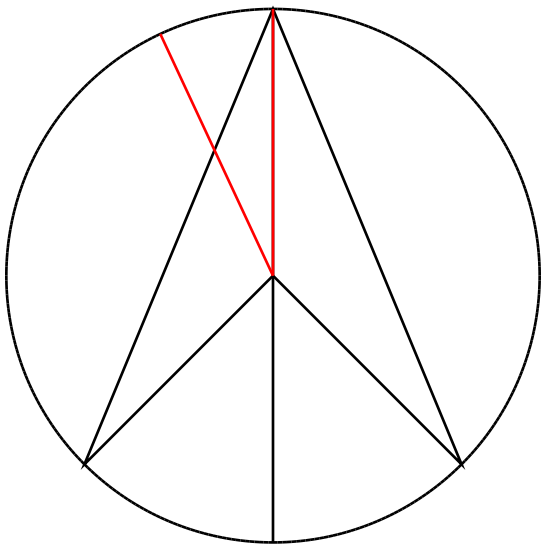
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



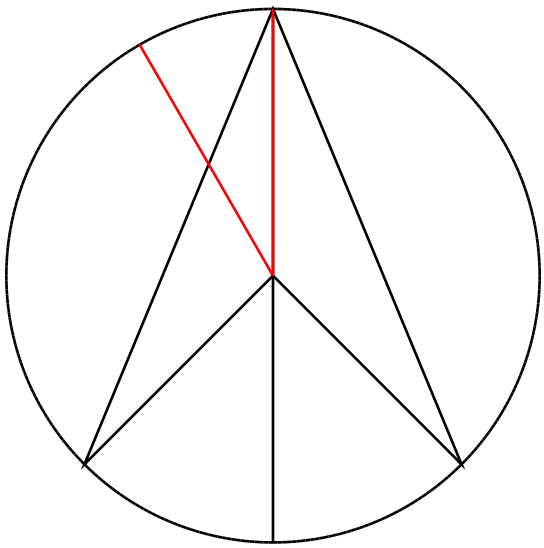
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



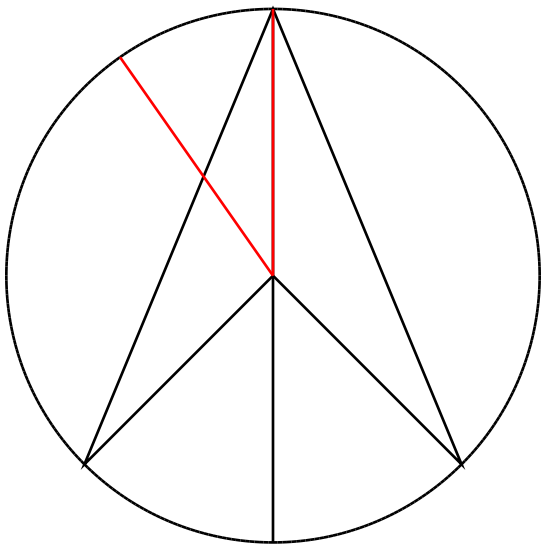
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



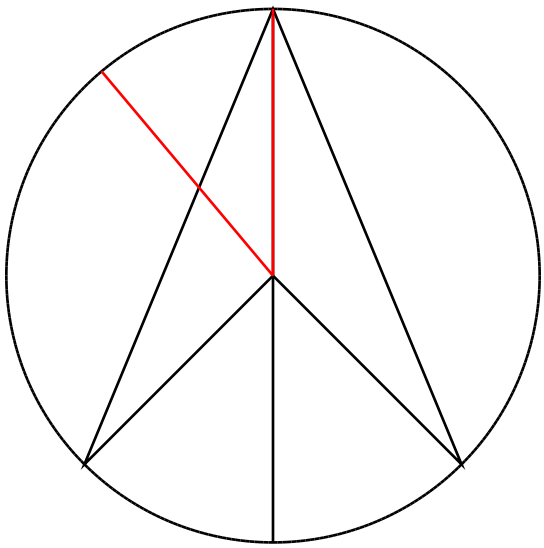
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



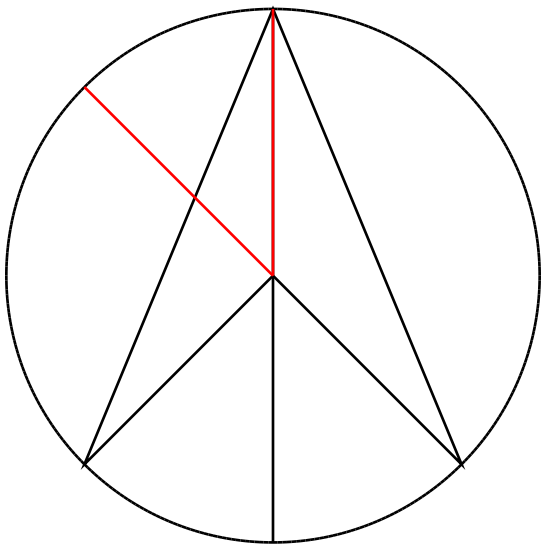
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



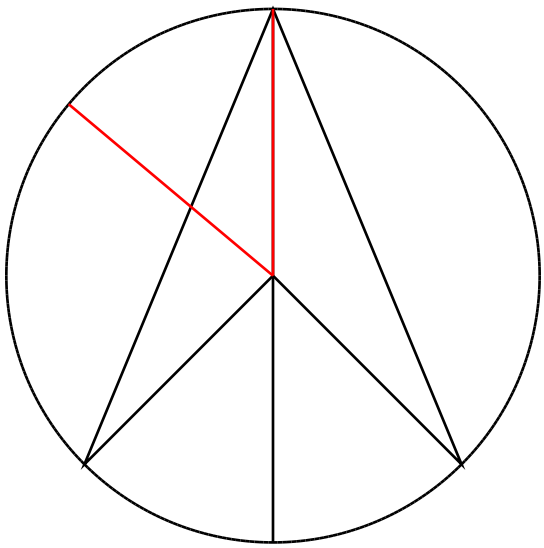
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



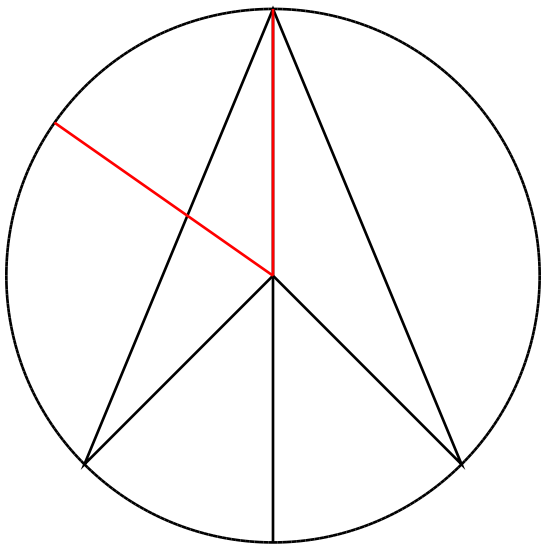
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



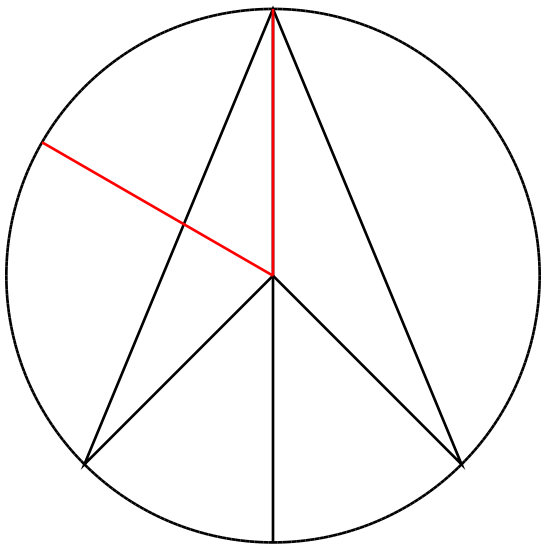
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



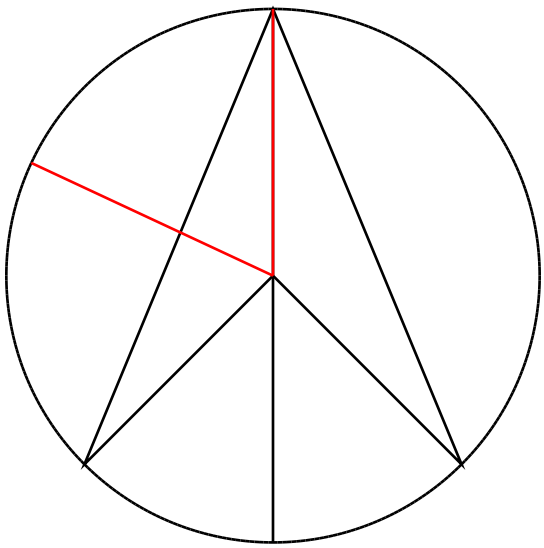
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



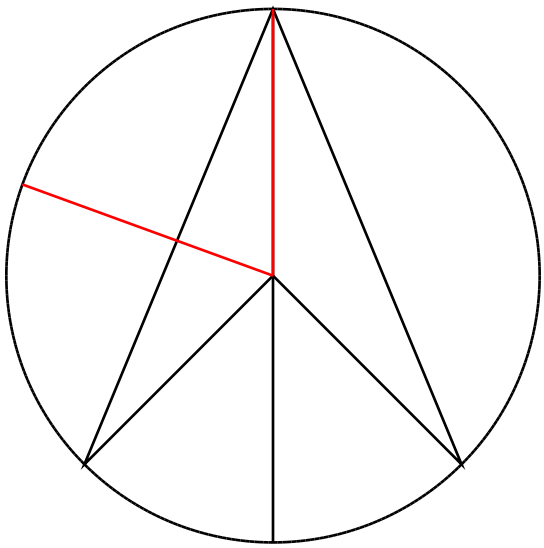
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



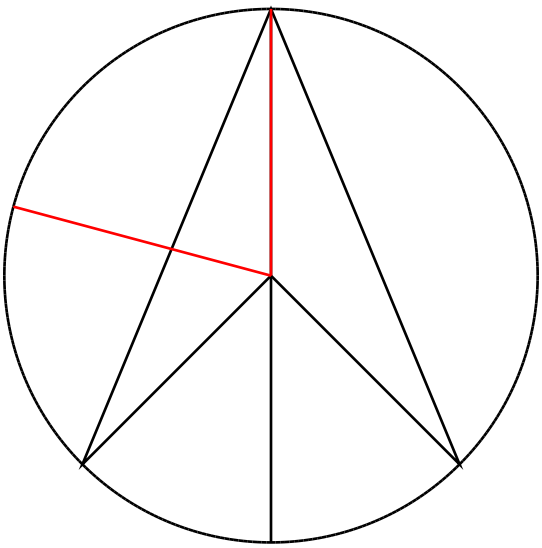
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



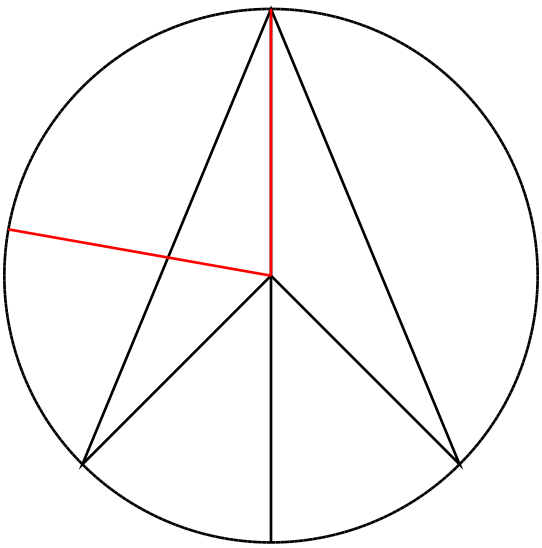
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



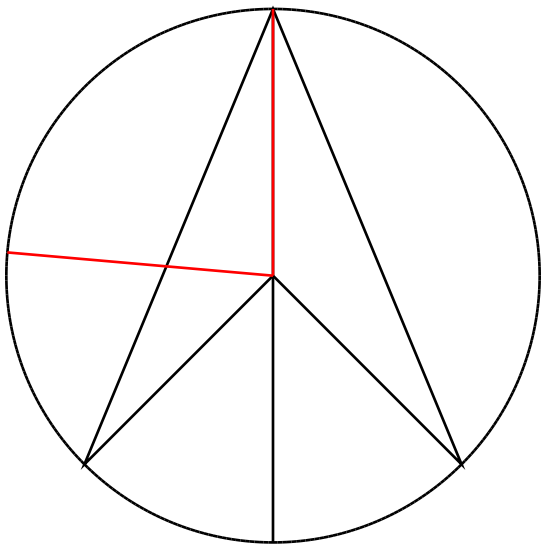
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



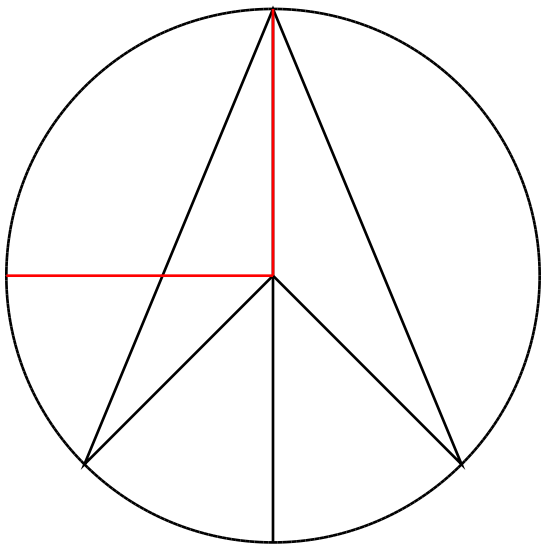
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



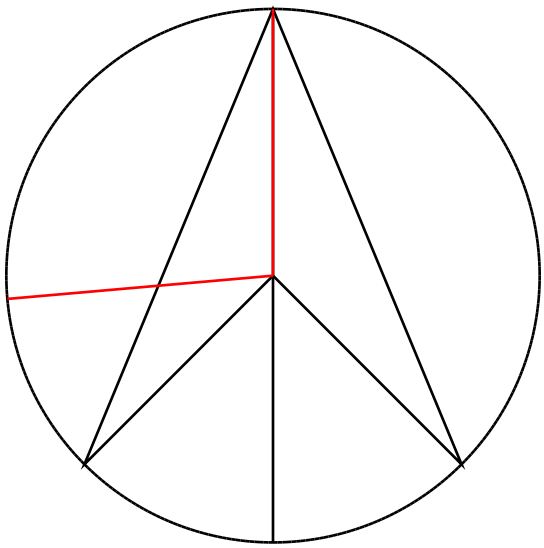
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



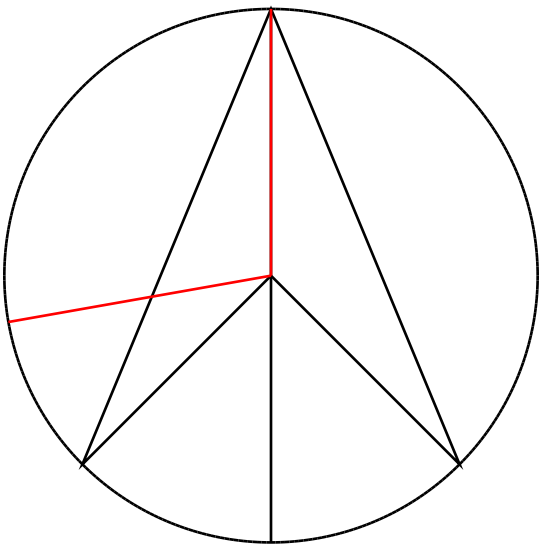
Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.



Proposition 20: In a circle, the angle at the center is double the angle at the circumference, when the angles have the same circumference as the base.

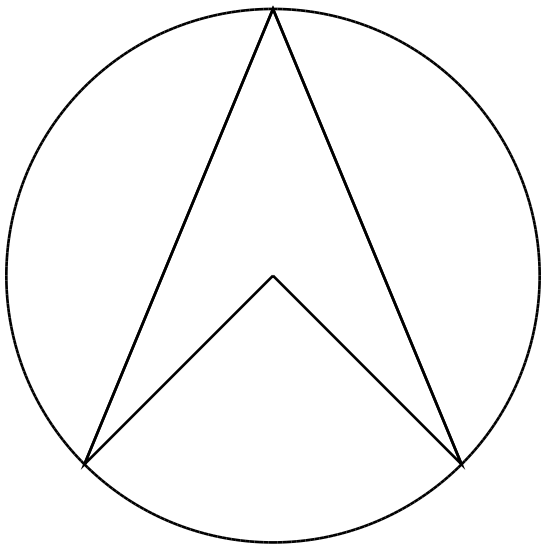
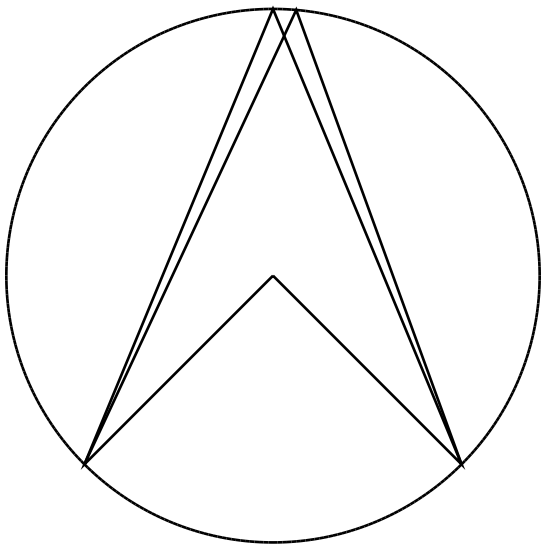
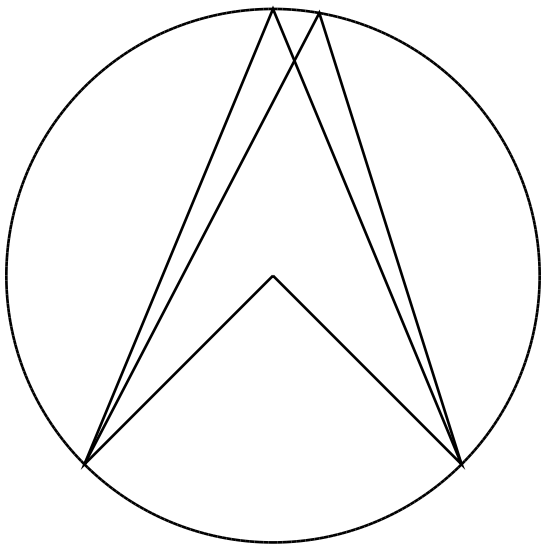
Proposition 21: In a circle, the angles in the same segment equal one another.



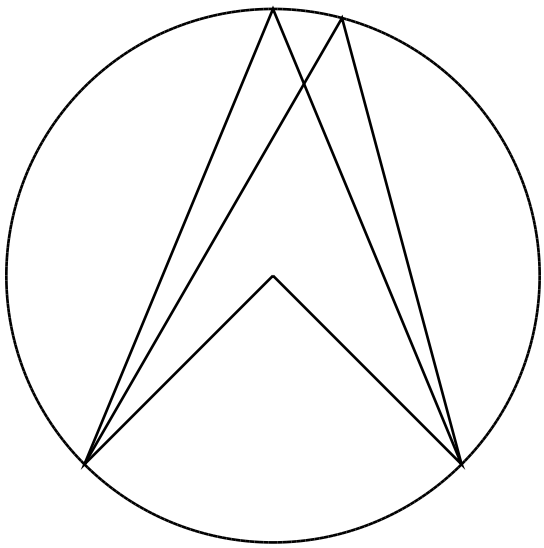
Proposition 21: In a circle, the angles in the same segment equal one another.



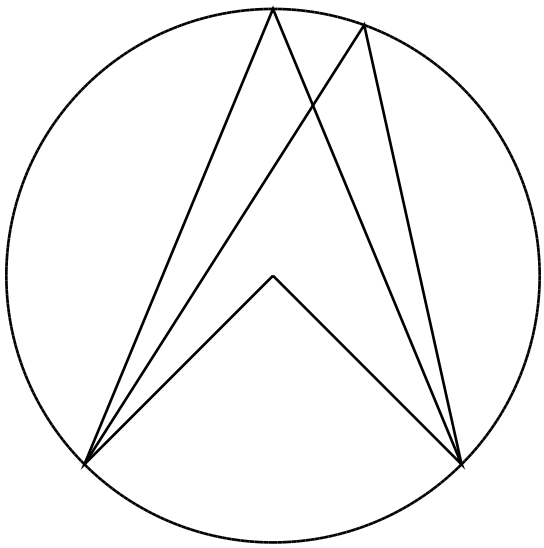
Proposition 21: In a circle, the angles in the same segment equal one another.



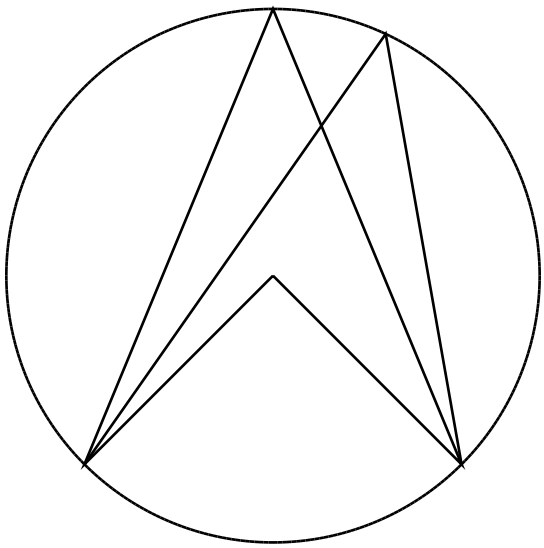
Proposition 21: In a circle, the angles in the same segment equal one another.



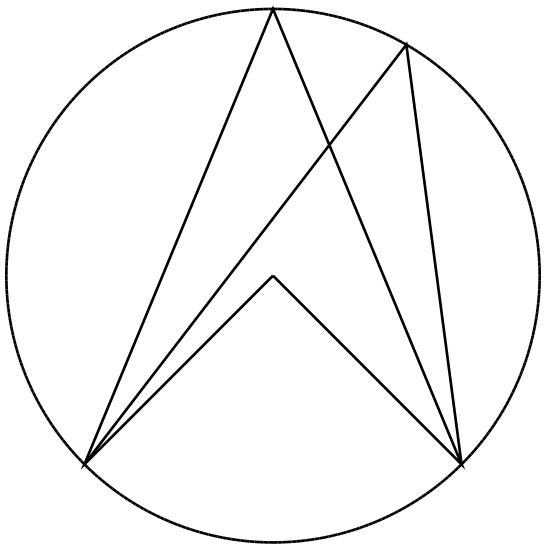
Proposition 21: In a circle, the angles in the same segment equal one another.



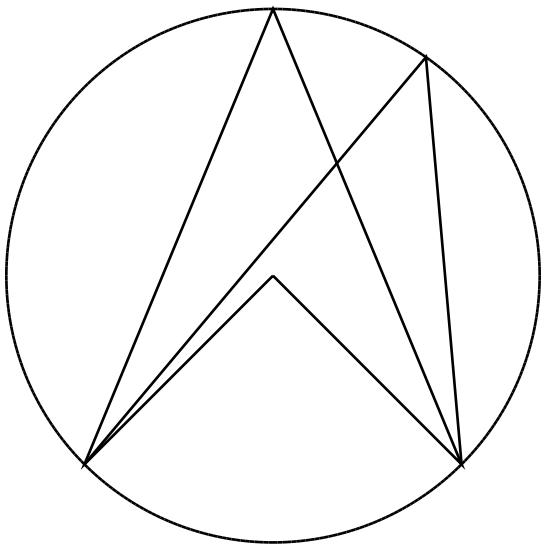
Proposition 21: In a circle, the angles in the same segment equal one another.



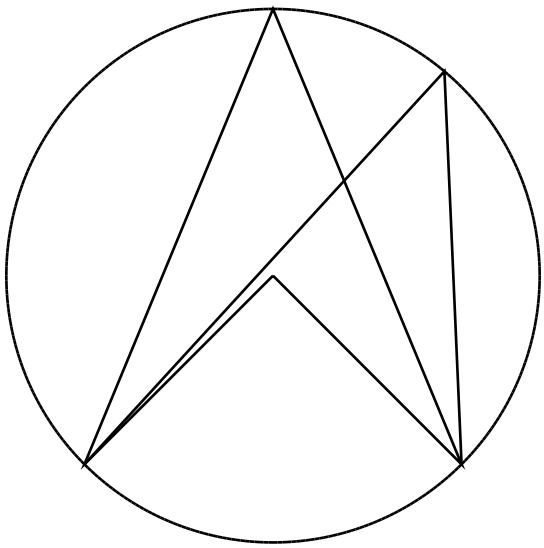
Proposition 21: In a circle, the angles in the same segment equal one another.



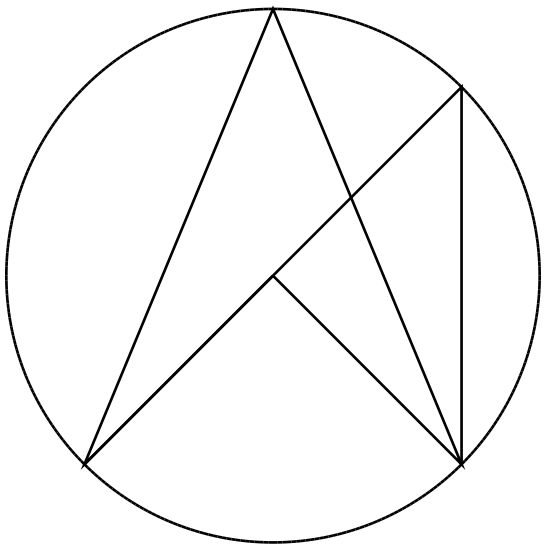
Proposition 21: In a circle, the angles in the same segment equal one another.



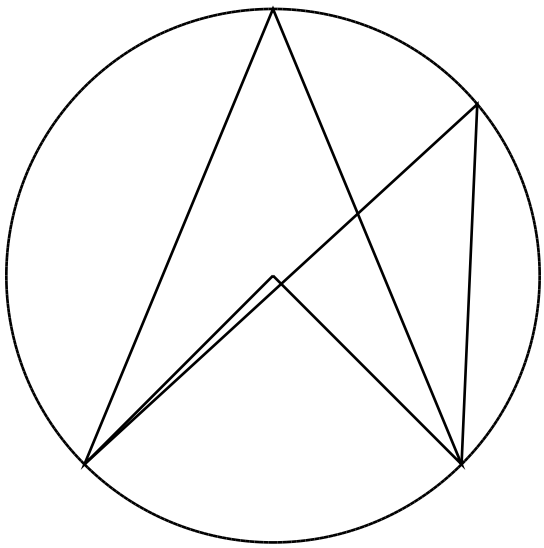
Proposition 21: In a circle, the angles in the same segment equal one another.



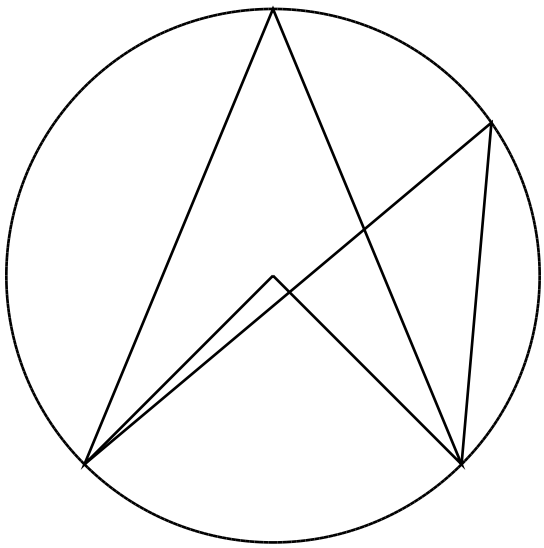
Proposition 21: In a circle, the angles in the same segment equal one another.



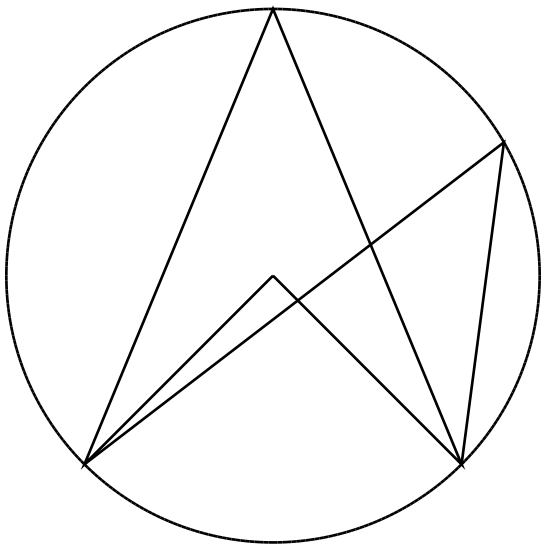
Proposition 21: In a circle, the angles in the same segment equal one another.



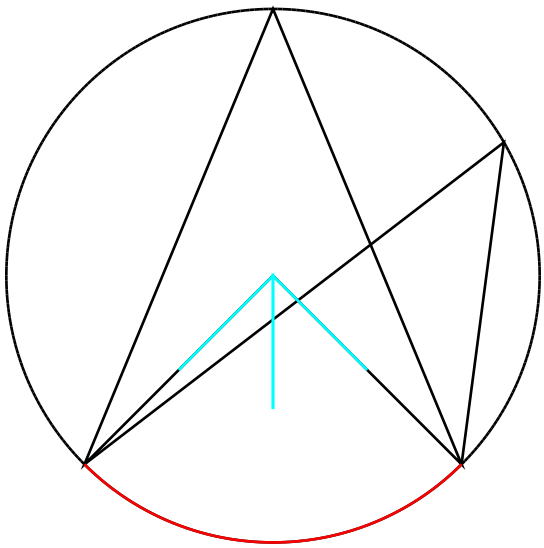
Proposition 21: In a circle, the angles in the same segment equal one another.



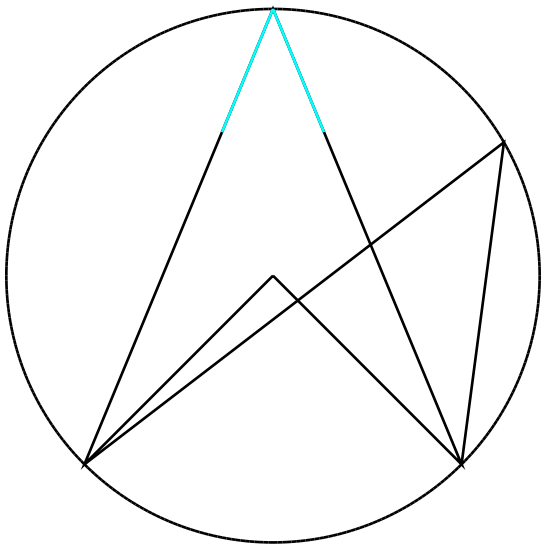
Proposition 21: In a circle, the angles in the same segment equal one another.



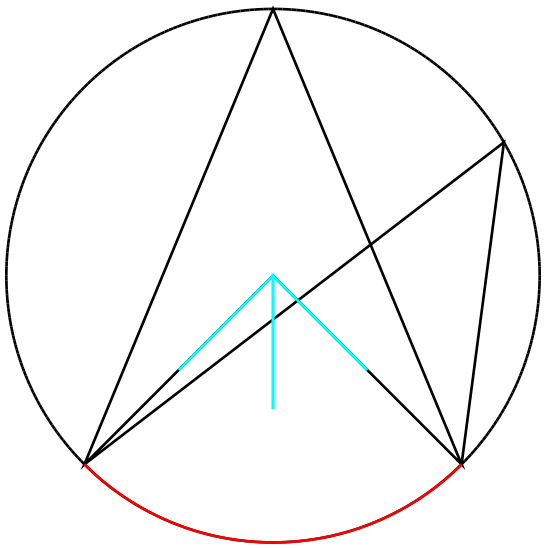
Proposition 21: In a circle, the angles in the same segment equal one another.



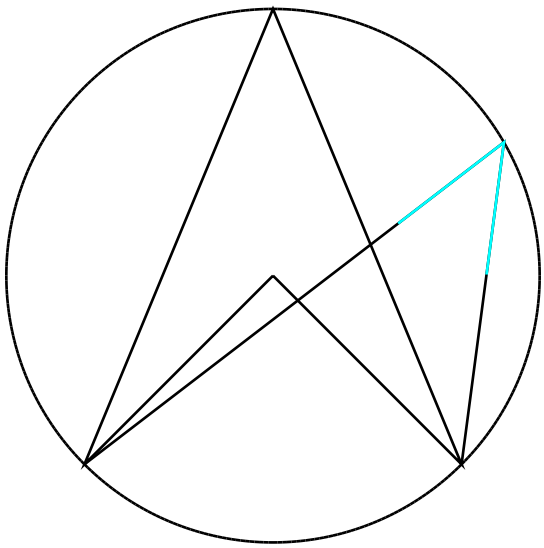
Proposition 21: In a circle, the angles in the same segment equal one another.



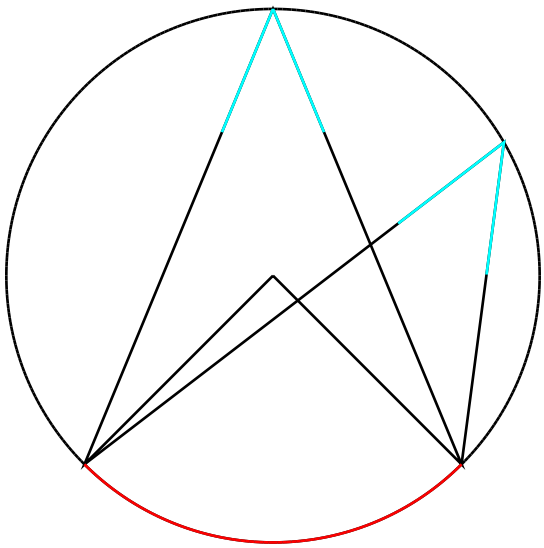
Proposition 21: In a circle, the angles in the same segment equal one another.



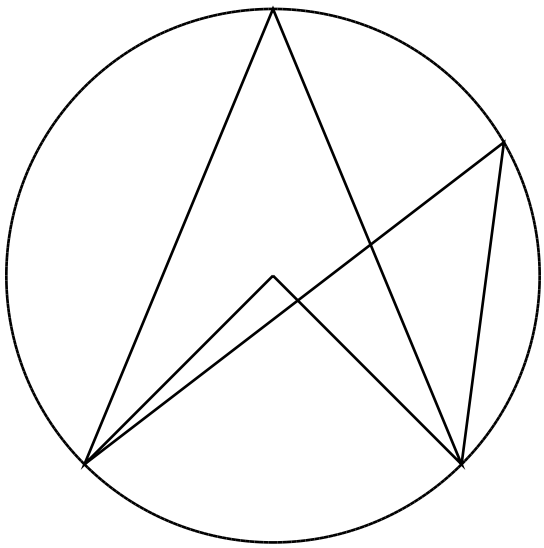
Proposition 21: In a circle, the angles in the same segment equal one another.



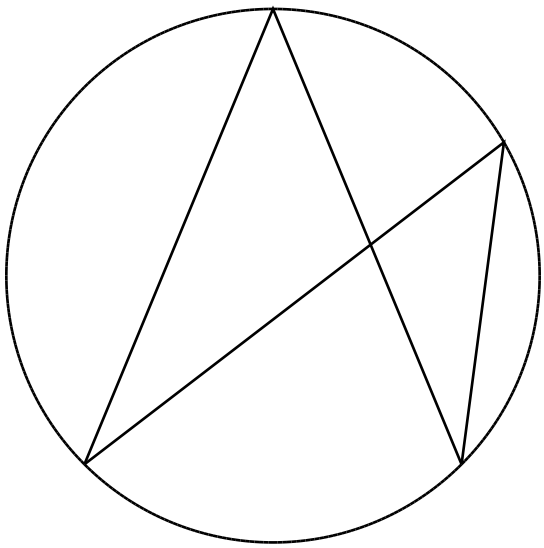
Proposition 21: In a circle, the angles in the same segment equal one another.



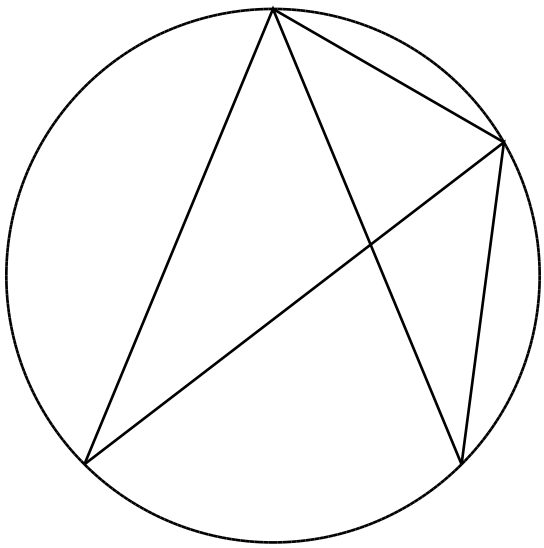
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



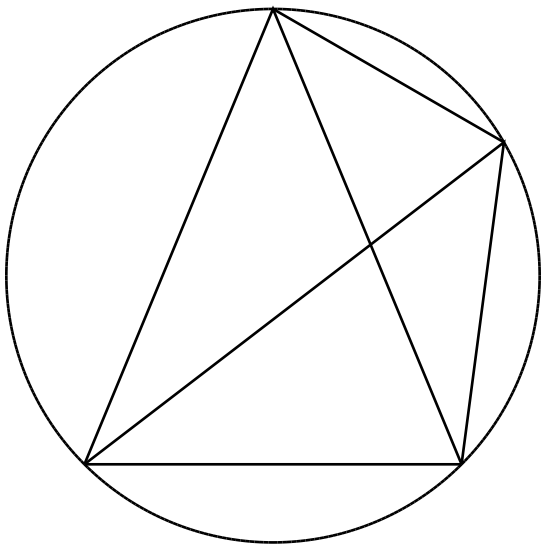
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



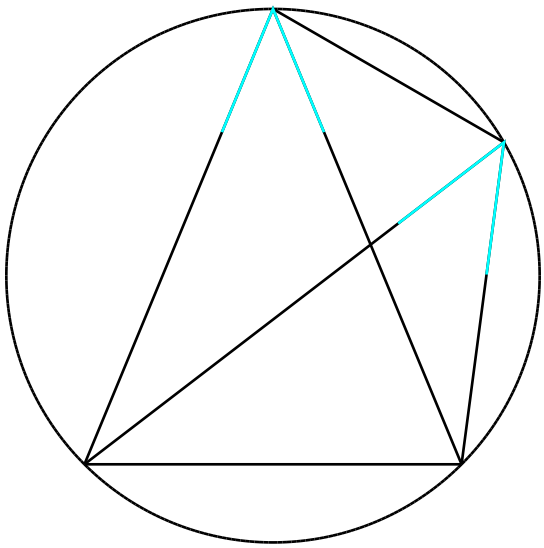
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



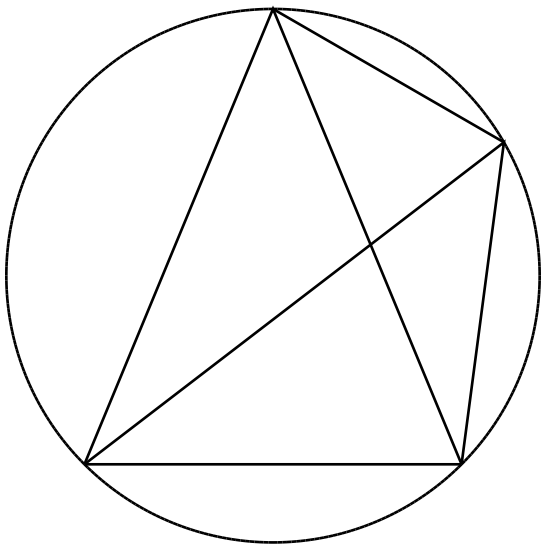
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



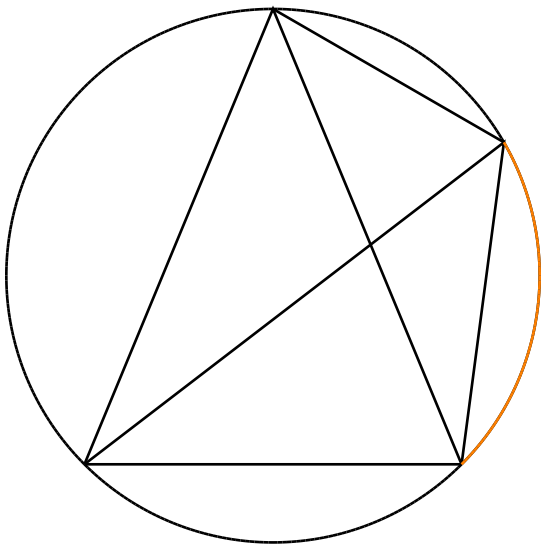
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



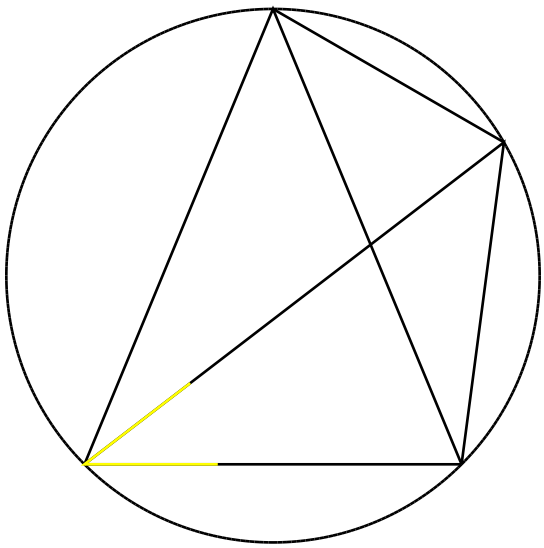
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



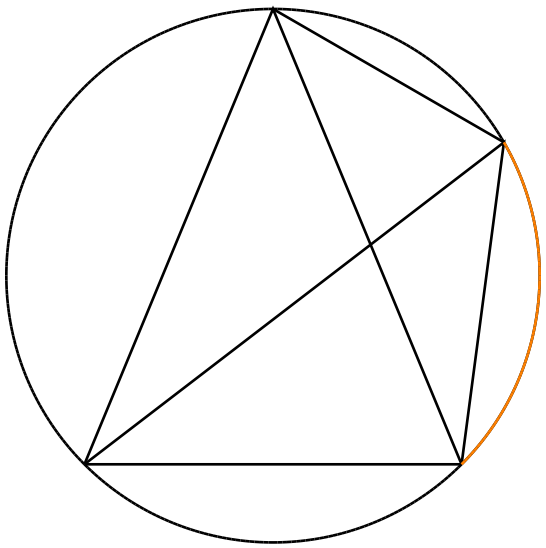
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



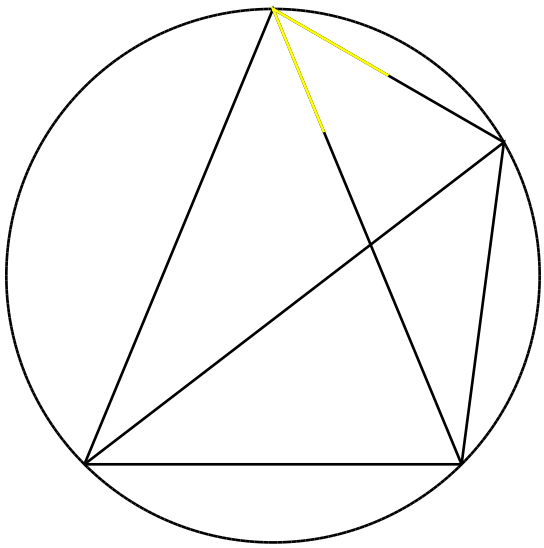
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



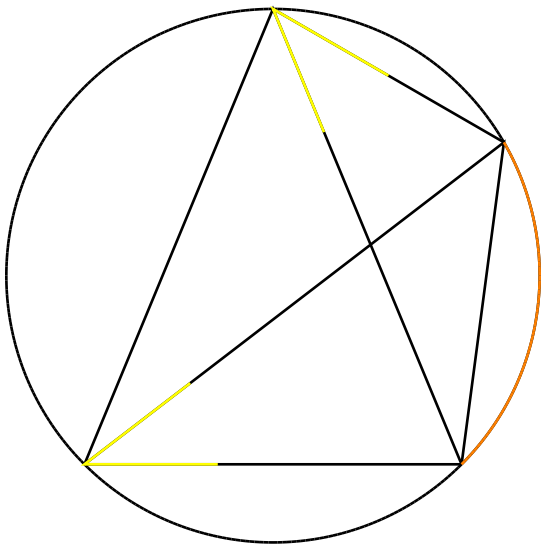
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



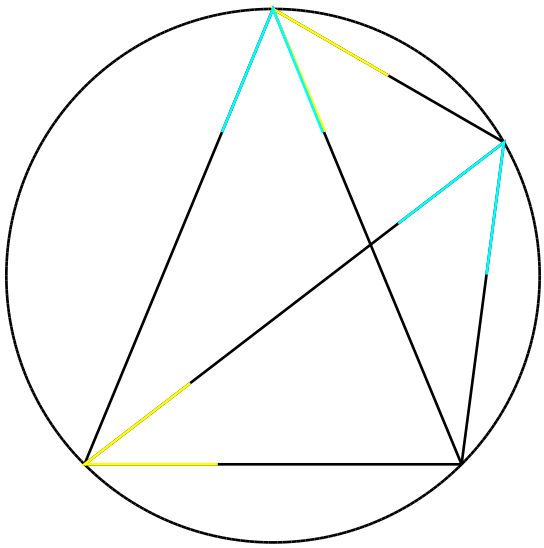
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



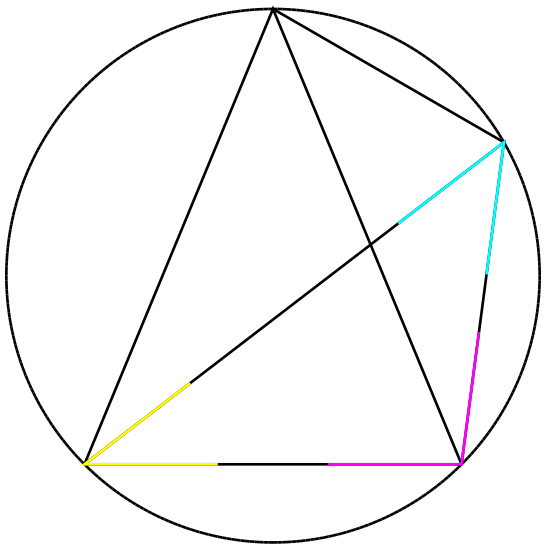
Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.



Proposition 22: The sum of the opposite angles of quadrilaterals in circles equals two right angles.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.

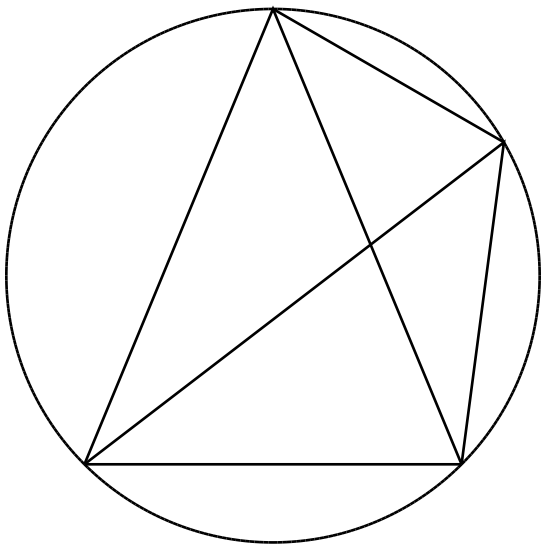
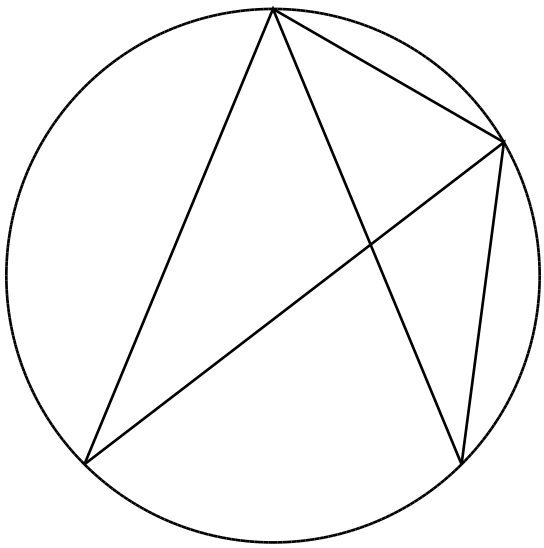
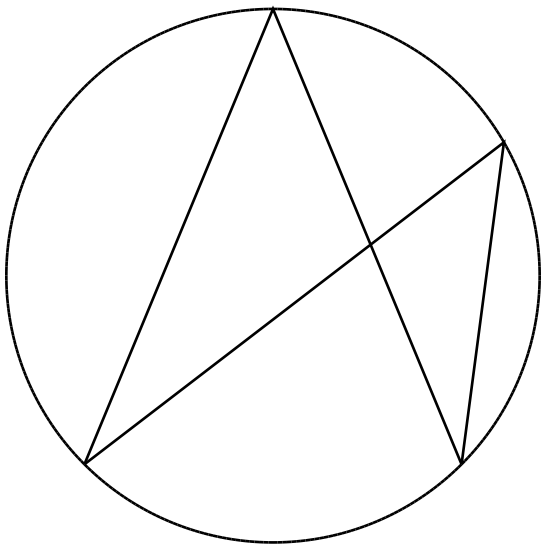
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



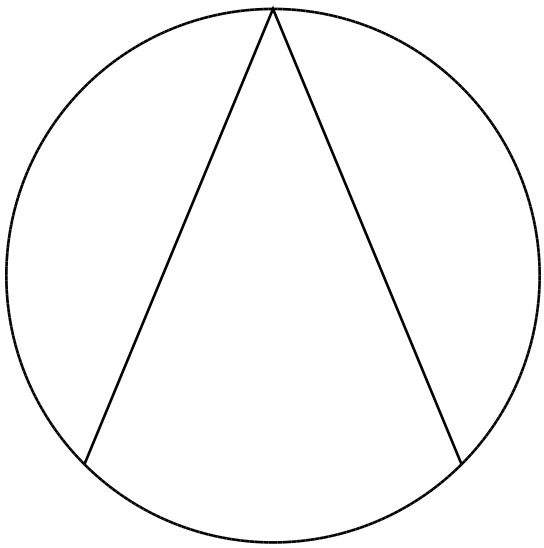
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



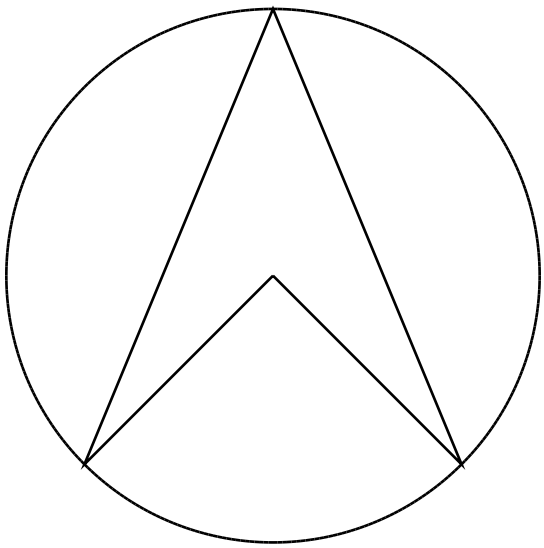
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



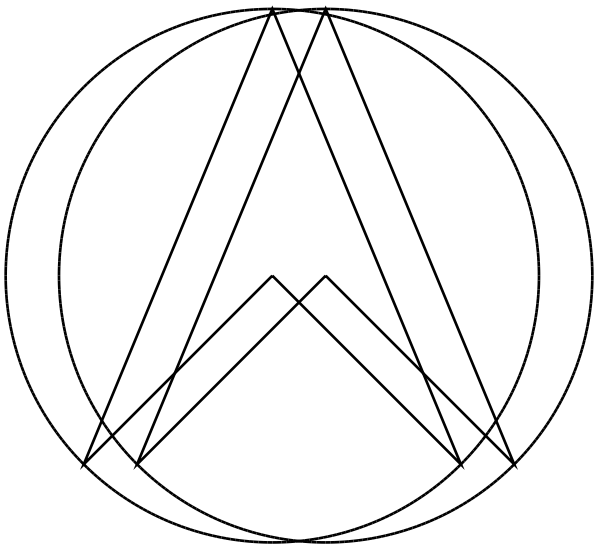
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



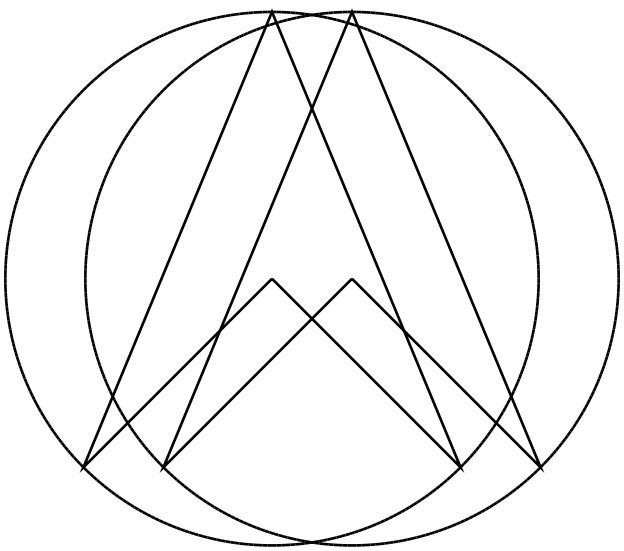
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



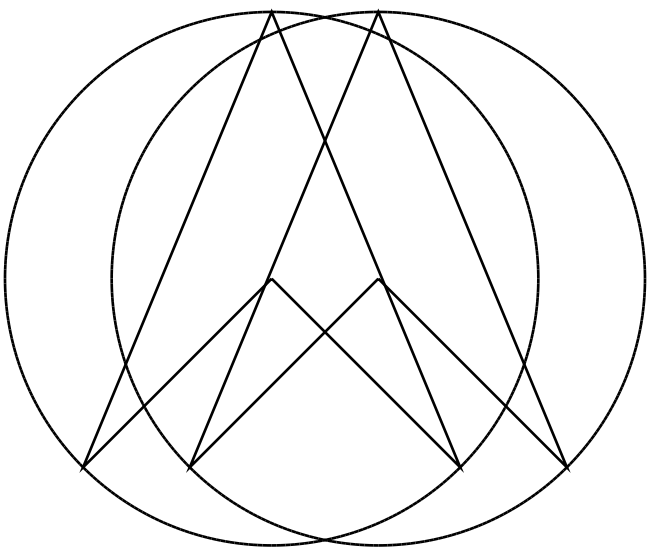
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



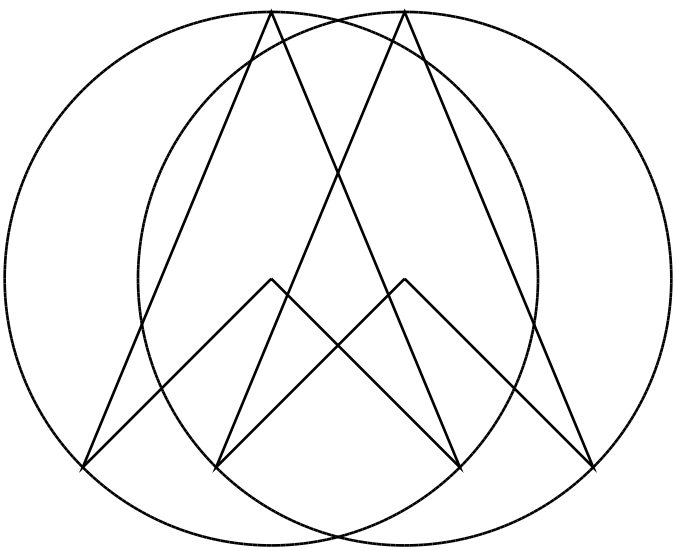
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



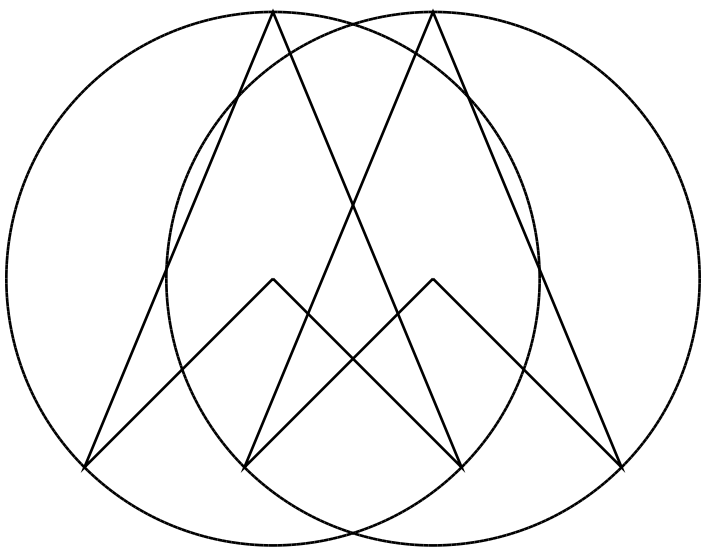
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



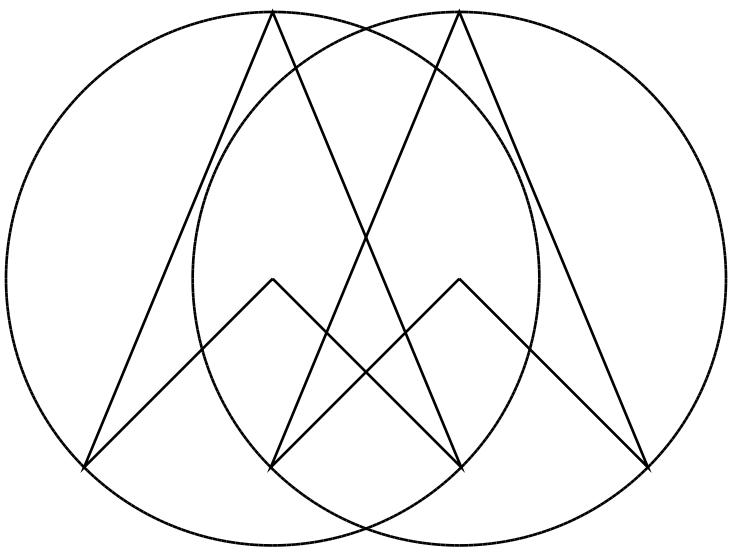
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



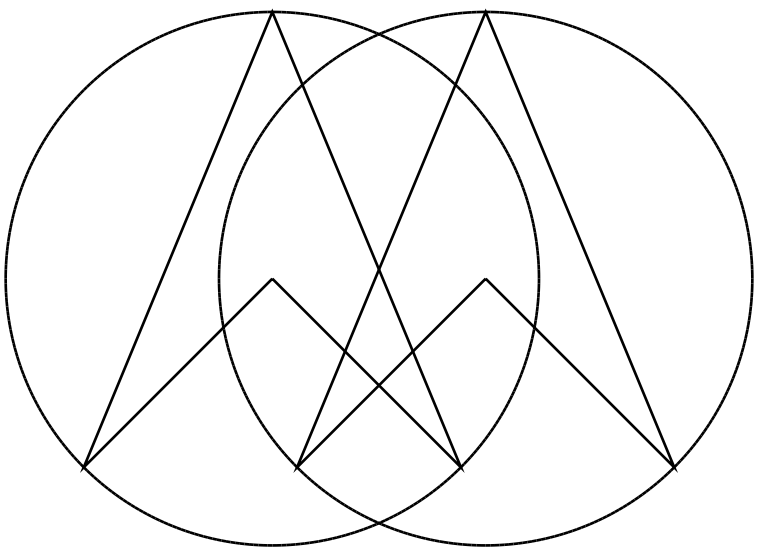
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



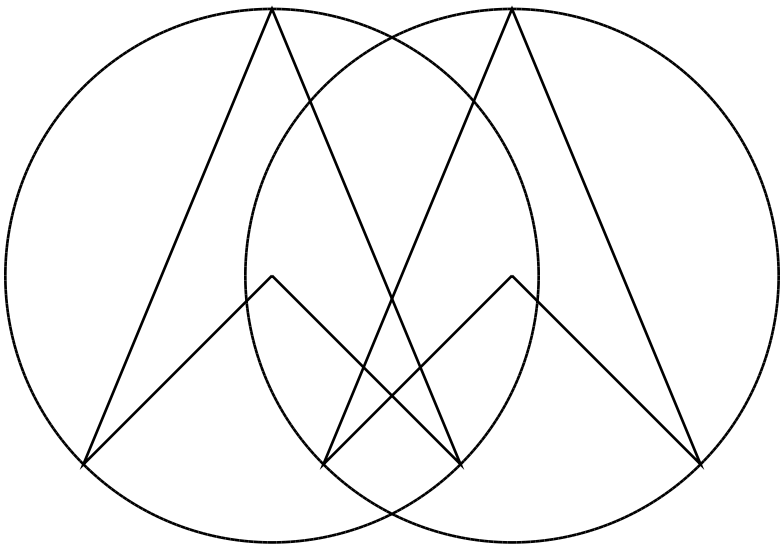
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



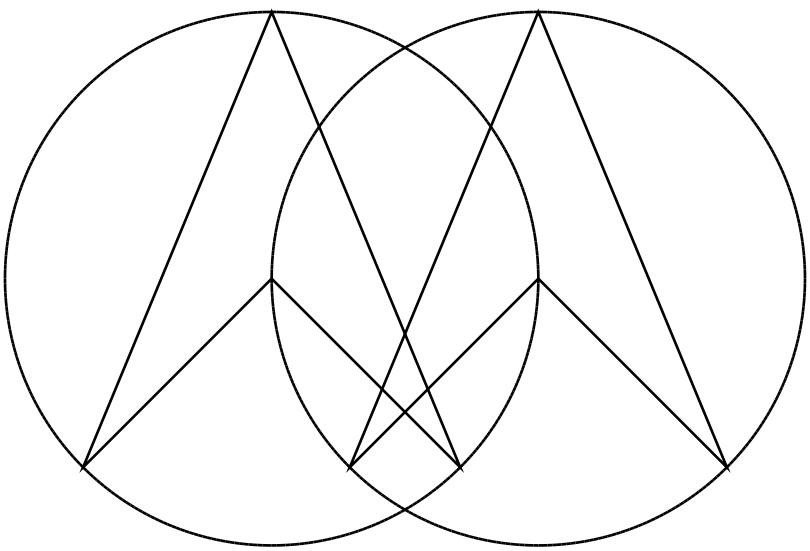
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



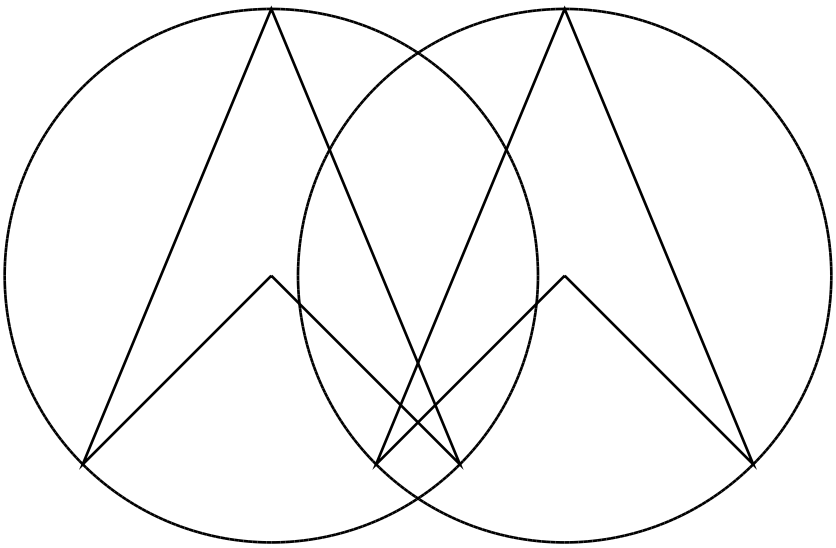
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



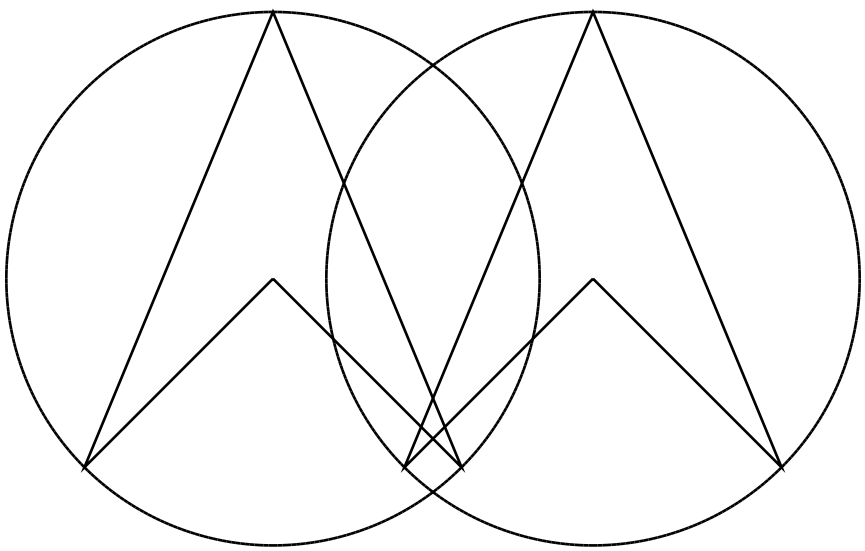
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



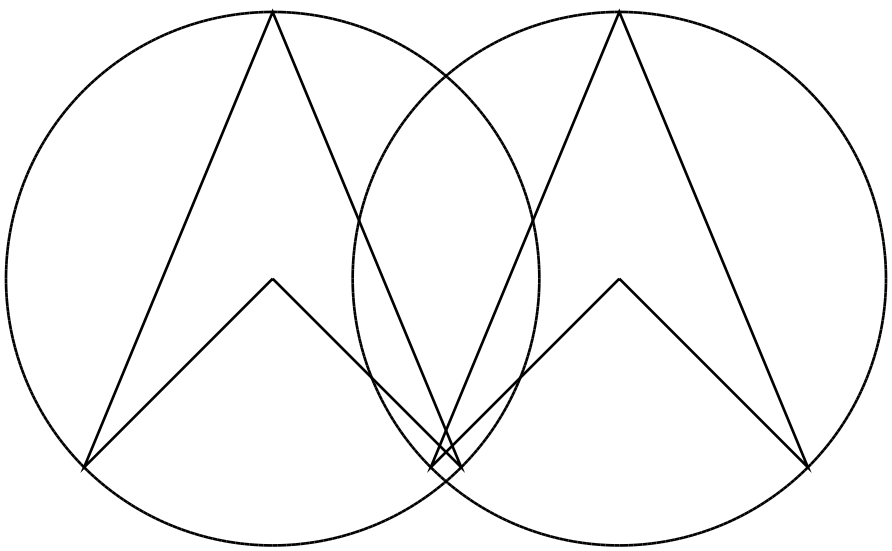
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



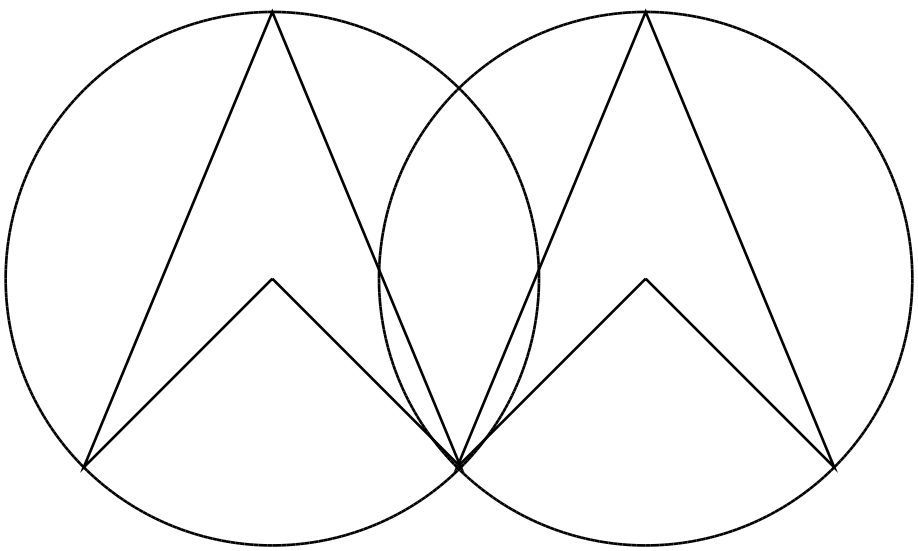
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



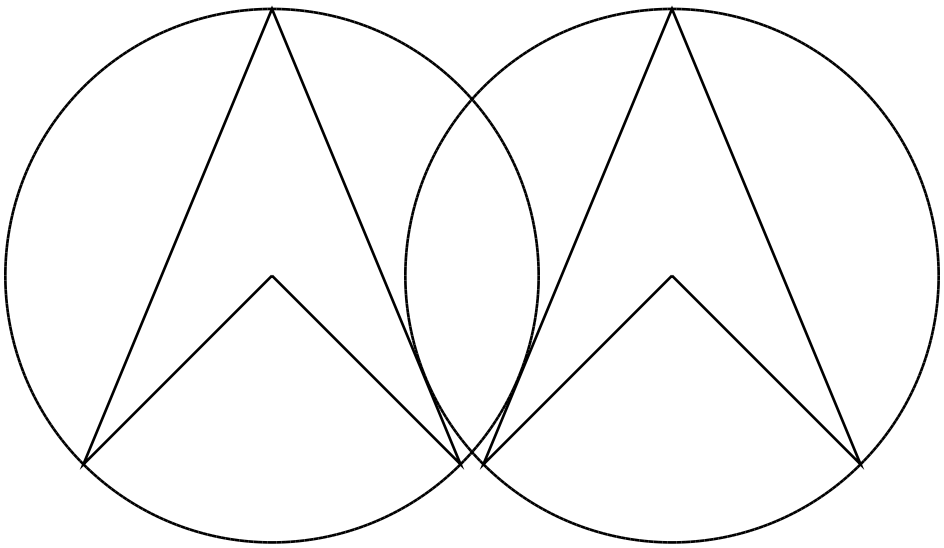
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



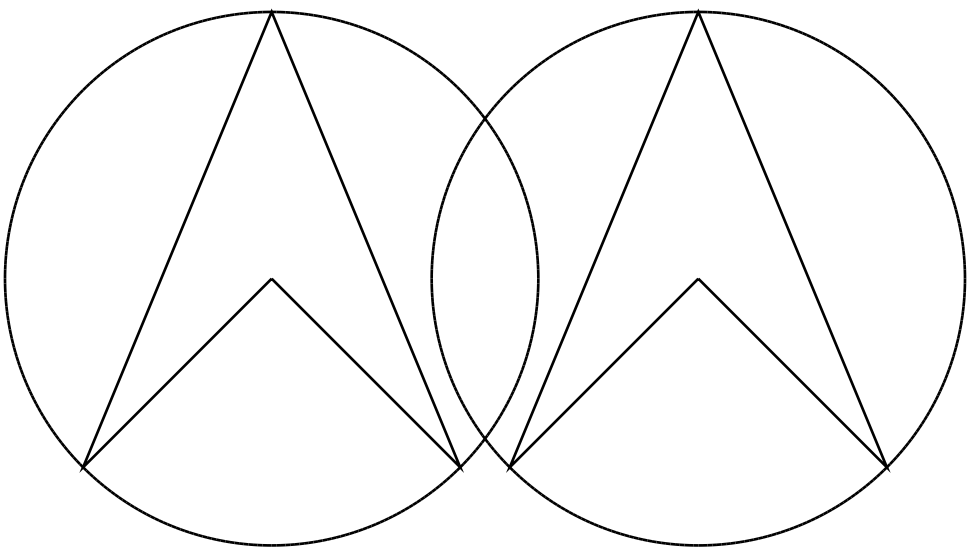
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



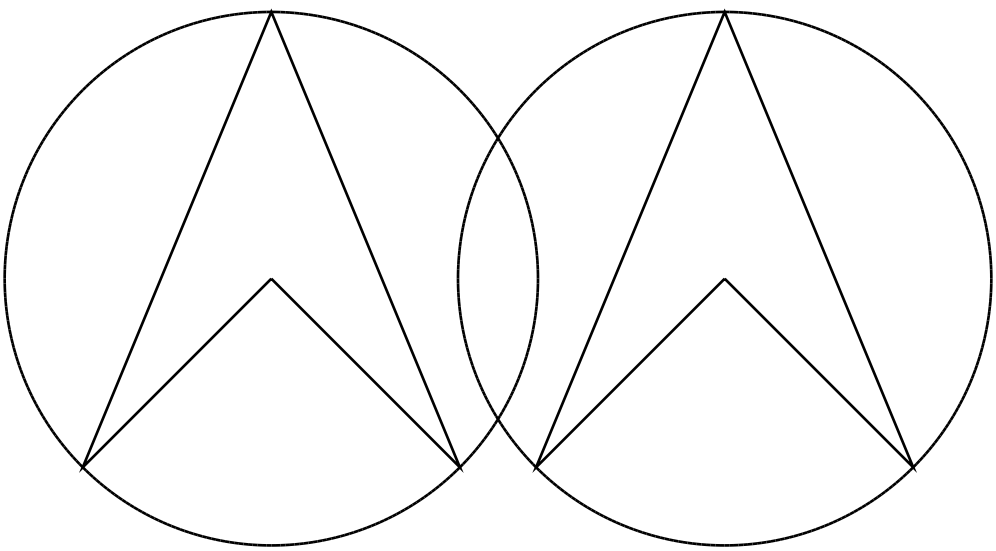
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



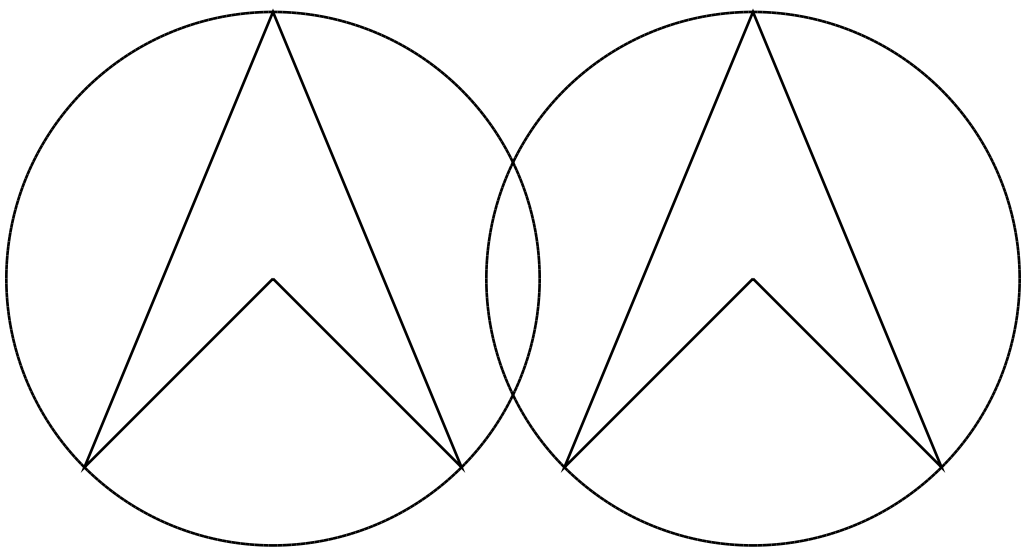
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



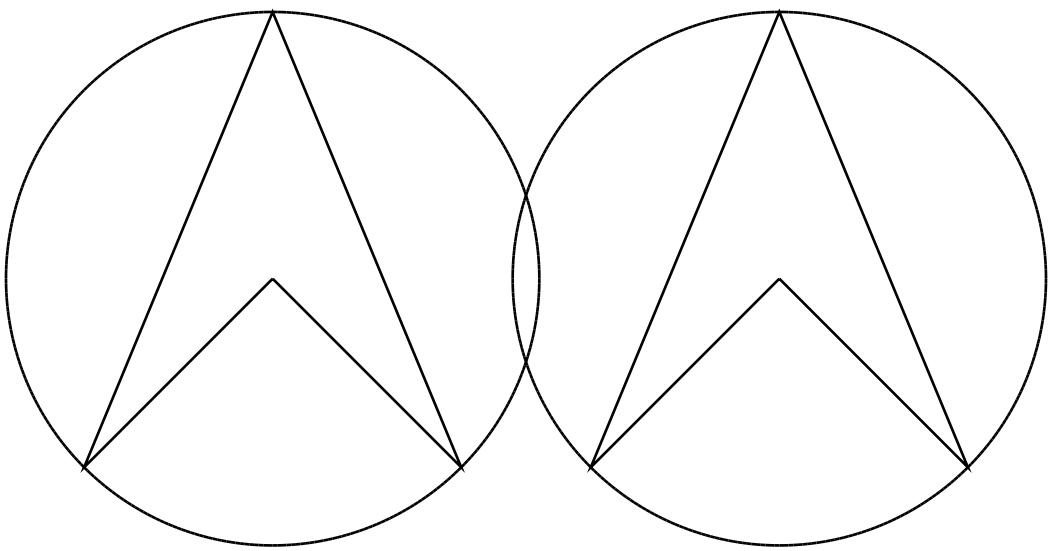
Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.



Proposition 27: In equal circles, angles standing on equal circumferences equal one another whether they stand at the centers or at the circumferences.
