How to hand in homework

The mathematical parts are to be handed in the usual way—on paper. Please write clearly. But the PostScript parts are to be handed in electronically. Either (1) by e-mail; or (2) on a floppy disk. A disk should have your name, assignment number, date marked on it.

Either way, the basic point is that what you hand in should run as a single PostScript program, which I can view by turning pages under GhostScript. Pages are separated by `showpage`.

Each assignment should be handed in as a single file. If for some reason you want to change what you hand in, send me again a single file with everything on it.

At the beginning and end of every file I want a PostScript comment with your name and the assignment number as well as the date.

Separate questions should be on separate pages, although a single question may take up several pages.

It is a good idea to put a `gsave` at the top of every page and a `grestore` at the end, and to set up your scale etc. all over again on every page. There are many ways to do this, so I won't give details.

If I ask you to write a procedure to do something, then you should define the procedure towards the beginning of the question and include a sample of how it works at the end, so that your file will demonstrate with a picture how things work. It should be explained clearly if necessary how your procedure is used, so thyat I can modify the parameters in your example to see what happens in different circumstances.

You should page through your file yourself to by sure that what I will see is what you want me to see.

Whenever you make a choice that is not dictated by the assignment question and not in some way the obvious thing to do, explain clearly what choice you have made and perhaps why.
