

Math 190 Logarithm Note

Review the following Lab questions to make sure you are solving efficiently.

Questions:

1. Let's solve for x in the following:

$$e^{2\ln x} = 7.$$

Now we could take the natural logarithm of both sides, solve for $\ln x$ and then take e to the power of both sides. That is

$$\ln(e^{2\ln x}) = \ln 7$$

$$2 \ln x = \ln 7$$

$$\ln x = \frac{\ln 7}{2}$$

$$e^{\ln x} = e^{\frac{\ln 7}{2}}$$

$$x = e^{\frac{\ln 7}{2}}$$

$$x = (e^{\ln 7})^{1/2}$$

$$x = \sqrt{7}$$

Alternatively we can use exponent rules to write

$$e^{2\ln x} = 7$$

$$(e^{\ln x})^2 = 7$$

$$x^2 = 7$$

$$x = \sqrt{7}.$$

2. Now let's solve

$$\ln(3e^{2x}) = 4.$$

Again we could take e to the power of both sides, divide both sides by 3 and then take \ln of both sides. That is

$$e^{\ln(3e^{2x})} = e^4$$

$$3e^{2x} = e^4$$

$$e^{2x} = \frac{e^4}{3}$$

$$2x = \ln\left(\frac{e^4}{3}\right)$$

$$2x = \ln(e^4) - \ln(3)$$

$$x = \frac{4 - \ln(3)}{2}.$$

Alternatively we can use log rules to see

$$\begin{aligned}\ln(3e^{2x}) &= 4 \\ \ln(3) + \ln(e^{2x}) &= 4 \\ 2x &= 4 - \ln(3) \\ x &= \frac{4 - \ln(3)}{2}.\end{aligned}$$
