

Math 342 Problem set 12 (due 8/4/09)

Subgroups and Lagrange's Theorem

Let $G = \text{GL}_2(\mathbb{F}_p)$, and let $B = \left\{ \begin{pmatrix} a & b \\ & d \end{pmatrix} \in G \right\}$, $N = \left\{ \begin{pmatrix} 1 & b \\ & 1 \end{pmatrix} \in G \right\}$, $T = \left\{ \begin{pmatrix} a & \\ & d \end{pmatrix} \in G \right\}$.

In Problem Set 11 we saw that the order of G (the number of its elements) is $(p+1)p(p-1)^2$.

- (orders of the groups)
 - Find the order of B .
 - Find the order of T .
 - Find the order of N .
 - Check that $\#B = \#N \cdot \#T$.
- (Lagrange's Theorem) Among the groups G, B, N, T find all pairs such that one is a subgroup of the other. In each case verify that the order of the subgroup divides the order of the larger group. (For example: N is a subgroup of G so its order must divide the order of G).
- (B/T ; see Example 7.4.13 in the notes)
 - Let $n_1, n_2 \in N$ be distinct. Show that $n_1 \not\equiv_L n_2 (T)$. Conclude that all elements of N belong to different cosets modulo T .
Hint: what is $n_2^{-1}n_1$? When would it belong to T ?
 - Use Lagrange's Theorem and your answer to 1(d) to show that N is a complete system of representatives for B/T .
Hint: Can the number of cosets be larger than $\#N$?
 - Let $g = \begin{pmatrix} a & b \\ & d \end{pmatrix} \in B$ and let $t = \begin{pmatrix} \alpha & \\ & \delta \end{pmatrix} \in T$. Calculate the product $gt \in B$.
 - Given g , find t so that $gt \in N$. Conclude that every element of B belongs to the coset of an element of N and again show that N is a complete system of representatives.

OPTIONAL Following the same steps, show that T is a system of coset representatives for G/N .

A group isomorphism

- Let F be a field, $G = \text{GL}_n(F)$, $V = F^n$, $X = V \setminus \{0\}$ the set of non-zero vectors.
 - Show that for any $g \in G$, $x \in X$, we also have $gx \in X$.
 - Show that for any $g \in G$, the map $\sigma_g: X \rightarrow X$ given by $\sigma_g(x) = gx$ is a bijection of X to itself.
Hint: find an inverse to the map.
 - Show that the map $g \mapsto \sigma_g$ is a group homomorphism $G \rightarrow S_X$.
 - Assume that σ_g is the identity permutation. Show that g is the identity matrix. Conclude that the map from part (c) is injective.
 - Now assume $F = \mathbb{F}_2$, $n = 2$. What are the sizes of G ? Of V ? of X ? Show that in this case the map from part (c) is surjective, hence an isomorphism.

Optional Problems

- A. Let R be a ring, $I \subset R$ an ideal (a non-empty subset closed under addition and under multiplication by elements of R). Consider the relation $f \equiv g (I) \iff f - g \in I$ defined for $f, g \in R$.
- Show that $f \equiv g (I)$ is an equivalence relation.
 - Show that the set R/I of equivalence classes has a natural ring structure so that the map $Q: R \rightarrow R/I$ given by $Q(f) = [f]_I$ is a surjective ring homomorphism.
 - Let J be an ideal of R/I . Show that $Q^{-1}(J)$ is an ideal of R .
 - Assume that every ideal of R is principal. Show that every ideal of R/I is principal.
- B. Let F be a field, $R = F[x]$, $I = (x^n - 1) = \{f(x^n - 1) \mid f \in R\}$, $\bar{R} = R/I$. Show that the restriction of the quotient map $Q: R \rightarrow \bar{R}$ to the subset $F[x]^{<n}$ is bijective. It is an isomorphism of vector spaces over F .
- C. The cyclic group C_n acts on F^n by cyclically permuting the co-ordinates. Show that under the usual identifications of F^n with $F[x]^{<n}$ and $F[x]^{<n}$ with $F[x]/(x^n - 1)$, the action of the generator of C_n in F^n corresponds to multiplication by x in \bar{R} .
- D. Let $C \subset F^n$ be a *cyclic code*, that is a code for which if $\underline{v} = (v_1, \dots, v_n)$ is a code word then $(v_2, v_3, v_4, \dots, v_n, v_1)$ is also a codeword. Show that under the correspondence above a cyclic code C is the same as an ideal in \bar{R} .
Hint: Let $J \subset F[x]$ be a linear subspace closed under multiplication by x . Show by induction on the degree of $f \in F[x]$ that J is closed under multiplication by f .
- E. Let C be a cyclic code, $J \subset \bar{R}$ the corresponding ideal. Let $g \in R$ be a polynomial of minimal degree such that $Q(g)$ generates J (this exists by problem A(d)). Show that $\text{GCD}(g, x^n - 1)$ also generates J . Conclude that $g \mid x^n - 1$.
