

## Math 312: Problem Set 5 (due 8/6/11)

### Arithmetic functions

- In this exercise,  $f, g$  are multiplicative functions. You are also given that for  $n \in \{2, 3, 4, 5, 7, 8, 9\}$ ,  $f(n) = 4n - 3$  and  $g(n) = n + 2$ .
  - Calculate  $f$  at each of 6, 10, 12, 14, 15, 30.
  - Calculate  $f * g$  at 7, 18, 30.
- (Another Mersenne prime)
  - Let  $p, q$  be primes such that  $q | 2^p - 1$ . In class we showed that  $q \equiv 1 \pmod{p}$ . Show that if  $p$  is odd then  $q \equiv 1 \pmod{2p}$ .  
*Hint:*  $q - 1$  is even.
  - Prove that  $2^{13} - 1$  is prime by (i) Explicitly showing that it is not divisible by two specific primes and (ii) showing that your two trial divisions are enough.
- (An amusing identity)
  - Show that  $f(n) = 2^{\omega(n)}$  is a multiplicative function.  
*Hint:* Adapt the argument that proved that  $\mu$  was multiplicative.
  - Show that  $\sum_{d|n} f(d) = \tau(n^2)$ .  
*Hint:* First show that it is enough to check when  $n$  is a prime power, then do that case.  
SUPP What would happen for  $f(d) = b^{\omega(n)}$  for a general  $b \in \mathbb{Z}_{\geq 2}$ ?
- (§7.4.E30) Show that  $\Lambda * I = \log$ .  
*Hint:* Use the factorization of the integer under consideration.
- Define a function  $\chi_4(n) = \begin{cases} 1 & n \equiv 1 \pmod{4} \\ -1 & n \equiv 3 \pmod{4} \\ 0 & 2|n \end{cases}$  and set  $s(n) = \sum_{d|n} \chi_4(d)$  (i.e.  $s = \chi_4 * I$ ).
  - Show that  $\chi_4$  is completely multiplicative and conclude that  $s$  is multiplicative.
  - Calculate  $s(2), s(3), s(4), s(5)$ .
  - Let  $r_2(n) = \#\{(a, b) \in \mathbb{Z}^2 \mid a^2 + b^2 = n\}$  be the number of ways to write  $n$  as a sum of two squares of integers (possibly negative!). Show that  $r_2(n) = 4s(n)$  for  $n = 2, 3, 4, 5$ .  
RMK The identity  $r_2(n) = 4s(n)$  holds for all  $n$ . In particular,  $r_2$  is multiplicative.

### Cryptology

- Using the affine cipher  $C \equiv 5P + 7 \pmod{26}$ 
  - Encrypt the message: WE ARE GOING HOME X.
  - Decrypt the message: HOVYQ PBYVR VTLZZ WGZOX ZD.

7. The following message has been encoded using an affine cipher. Decode it and explain your reasoning
- NMCWT FIHHI ACPBN RSWHI NRUNG VSWBI BAUFS CPBAI YTHSI PNRSM  
 CTSCH HYIYW UMSFS NRSTG FGAGV SWCPB NRSYG YSFCN RWGEN AFCTS
- (Hint 1: the average frequency of letters in english falls according to ETAOIN)  
 (Hint 2: the author of passage is the Rev. C.L. Dodgson, well-known for such works as “Symbolic Logic Part I”)
8. Show that in the following two affine ciphers encryption and decryption are the same operation (that is, that  $E(E(P)) = P$ )
- (a) “ROT-13”, a popular cipher for internet discussion boards, for which the encryption function is  $E(P) \equiv P + 13 \pmod{26}$ .
- (b) “Atbash”, a historical cipher originally used in Hebrew, consisting of exchanging letters:  $a \leftrightarrow z, b \leftrightarrow y, c \leftrightarrow x$  and so on. Its encryption function is  $E(P) \equiv -1 - P \pmod{26}$ .
9. (§8.4.E6) What is the ciphertext that is produced when RSA encryption with the public key ( $e = 7, n = 2627$ ) is applied to the plaintext LIFE IS A DREAM ?
10. (§8.4.E8) In this problem you will do an RSA decryption when the public key is ( $e = 5, n = 2881$ ).
- (a) Calculate  $\phi(n)$  and find the decryption exponent  $d$ .
- (b) If the ciphertext is 0504 1874 0347 0515 2088 2356 0736 0468, what is the plaintext message?

### Supplementary problems (not for submission)

- A. Fix a prime  $p$ .
- (a) Let  $f(x) = \sum_{i=0}^n a_i x^i$  be a polynomial with integer coefficients. Use the identity of PS2 problem 8 to show that  $x - y$  divides  $f(x) - f(y)$  as polynomials.
- (b) Let  $c_1 \in \mathbb{Z}$  be such that  $f(c_1) \equiv 0 \pmod{p}$ . Plugging in  $c_1$  for  $y$  show that for some polynomial  $g(x)$  with integer coefficients we have a congruence of polynomials  $f(x) \equiv (x - c_1)g(x) \pmod{p}$ . Moreover,  $\deg(g) \leq \deg(f) - 1$ .
- (c) Let  $c_2 \in \mathbb{Z}$  also be such that  $f(c_2) \equiv 0 \pmod{p}$  and assume that  $c_1 \not\equiv c_2 \pmod{p}$ . Show that  $g(c_2) \equiv 0 \pmod{p}$ .
- (d) Show by induction on  $r$  that if  $\{c_j\}_{j=1}^r$  are representatives of the distinct congruence classes mod  $p$  which solve the equation  $f(x) \equiv 0 \pmod{p}$  then there is a polynomial  $g(x)$  of degree  $\leq n - r$  such that  $f(x) \equiv g(x) \prod_{j=1}^r (x - c_j) \pmod{p}$ .
- (e) Show that if  $f$  is not zero mod  $p$  then has at most  $n$  distinct roots mod  $p$ .
- B. Let  $f$  be an arithmetical function.
- (a) Show that  $f$  is invertible (there is  $g$  such that  $f * g = \delta$ ) iff  $f(1) \neq 0$ .
- (b) Let  $f$  be invertible. Show that it has a unique inverse and that  $(f^{-1})^{-1} = f$ .
- (c) Let  $f$  be invertible and multiplicative. Show that  $f^{-1}$  is multiplicative.
